# Linear Regression: **Prediction for Next Quarter One Year GDP Growth**

Presented By:  
Ally Ai, Xinwen Dong

# X1 : Private Domestic Investment Growth

NOTATION	VARIABLES	NAME	UNIT	FREQUENCY
Y	GDPgrowth	Real Gross Domestic Product	Percent Change from Preceding Period, Seasonally Adjusted Annual Rate	Quarterly
X1	PrivateInvest	Real Gross Private Domestic Investment	Percent Change from Preceding Period, Seasonally Adjusted Annual Rate	Quarterly

# X2 : Output Per Hour Growth

Reflection of investment in better technology and skills; More revenue and higher wages.

NOTATION	VARIABLES	NAME	UNIT	FREQUENCY
Y	GDPgrowth	Real Gross Domestic Product	Percent Change from Preceding Period, Seasonally Adjusted Annual Rate	Quarterly
X2	OutputperHr	Real Output Per Hour of All Persons (nonfarm)	Percent Change at Annual Rate, Seasonally Adjusted	Quarterly

# X3 : Buildings by Stage of Construction Growth

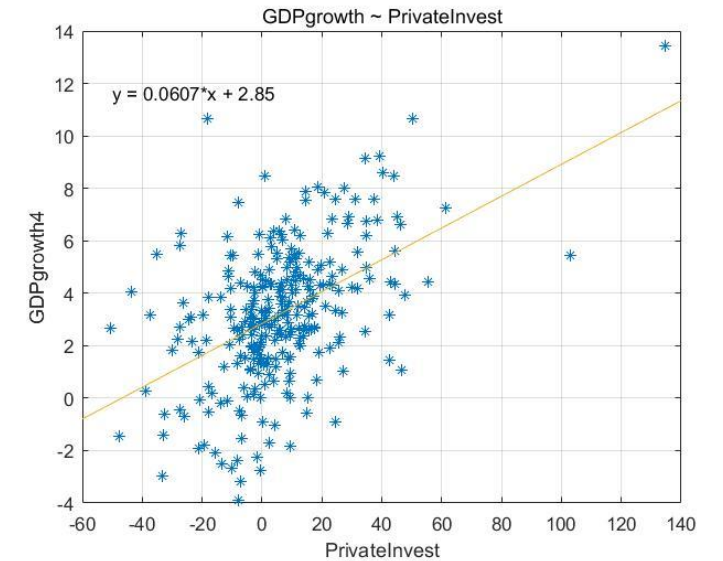

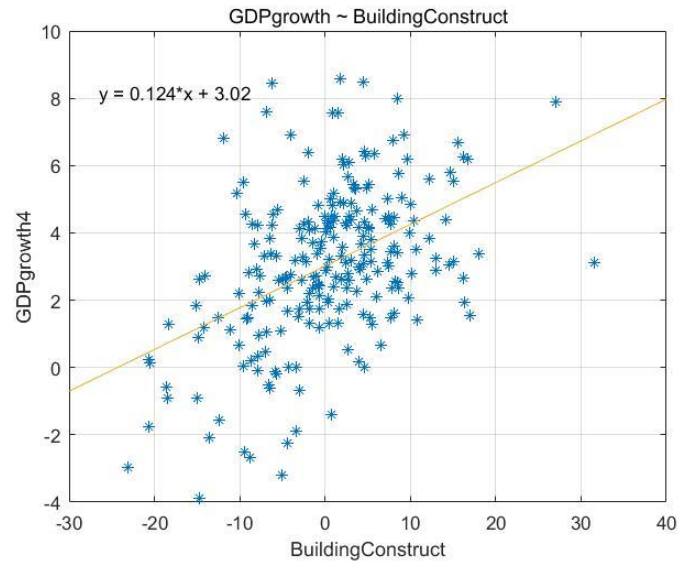

Biggest investment; Reflection of consumer confidence

NOTATION	VARIABLES	NAME	UNIT	FREQUENCY
Y	GDPgrowth	Real Gross Domestic Product	Percent Change from Preceding Period, Seasonally Adjusted Annual Rate	Quarterly
X3	BuildingConstruct	Total Dwellings and Residential Buildings by Stage of Construction	Growth Rate Previous Period, Seasonally Adjusted	Quarterly

# Simple Linear Regression

Variable	Linear Regression Model	Estimate	tStat	pValue	SE	R-Squared	Adj R-Squared	95% CI	# of Observations
BuildingConstruct	$GDPGrowth_{t:t+4}$ $= a + b * BuildingConstruct_t + u_{t+4}$	a=3.04	23.58	0.00	0.13	0.223	0.22	(2.78, 3.30)	232
		b=0.12	8.13	0.00	0.02			(0.08, 0.16)	
OutputperHr	$GDPGrowth_{t:t+4}$ $= a + b * OutputperHr_t + u_{t+4}$	a=1.97	9.29	0.00	0.21	0.181	0.178	(1.55, 2.39)	280
		b=0.59	7.83	0.00	0.08			(0.43, 0.75)	
PrivateInvest	$GDPGrowth_{t:t+4}$ $= a + b * PrivateInvest_t + u_{t+4}$	a=2.87	20.78	0.00	0.14	0.261	0.258	(2.59, 3.15)	283
		b=0.06	9.95	0.00	0.01			(0.04, 0.08)	

# Coding and Data (Jan 1<sup>st</sup> 1960 – July 31<sup>st</sup> 2018)

```
%% Import data
```

```
GDP = readtable('A191RL1Q225SBEA.xls');
```

```
%Total Dwellings and Residential Buildings by Stage of Construction,  
%Started for the United States, Growth Rate Previous Period, Quarterly,  
%Seasonally Adjusted
```

```
building = readtable('WSCNDW01USQ657S.xls');
```

```
%Real Gross Private Domestic Investment, Percent Change from  
%Preceding Period, Quarterly, Seasonally Adjusted Annual Rate  
investment = readtable('A006RL1Q225SBEA.xls');
```

```
%Nonfarm Business Sector: Real Output Per Hour of All Persons,  
%Percent Change From Quarter One Year Ago, Quarterly,  
%Seasonally Adjusted
```

```
outputphour = readtable('PRS85006091.xls');

```

### 3 Variables Linear Regression MATLAB Results

Linear regression model (robust fit):

$\text{GDPgrowth4} \sim 1 + \text{BuildingConstruct} + \text{PrivateInvest} + \text{OutputperHr}$

Estimated Coefficients:

	<b>Estimate</b>	<b>SE</b>	<b>tStat</b>	<b>pValue</b>	<b>95% CI</b>
<b>(Intercept)</b>	2.13	0.18	11.88	0.00	(1.77 , 2.49)
<b>BuildingConstruct</b>	0.10	0.01	6.94	0.00	(0.08 , 0.12)
<b>PrivateInvest</b>	0.04	0.01	4.60	0.00	(0.02 , 0.06)
<b>OutputperHr</b>	0.35	0.07	4.81	0.00	(0.21 , 0.49)

Number of observations: 232, Error degrees of freedom: 228

Root Mean Squared Error: 1.75

R-squared: 0.399, Adjusted R-Squared 0.391

F-statistic vs. constant model: 50.5, p-value = 4.53e-25

- ❖ tStats of each estimate are positive and greater than 2;
- ❖ p-Value less than 5% -> reject null hypothesis;
- ❖ 95% CI of each estimate far from zero, high correlations between independent and dependent variables;
- ❖ Therefore, estimate coefficients of the three independent variables are statistically significant and the regression model reflects 39.1% variability of data;

## Conclusion & Other Thoughts

$$GDPGrowth_{t:t+4} = 2.13 + 0.1 * BuildingConstruct_t + 0.04 * PrivateInvest_t + 0.35 * OutputperHr_t + u_{t+4}$$

- ❖ This equation shows the coefficients for variables BuildingConstruct, PrivateInvest and OutputperHr are 0.1, 0.04 and 0.35 correspondingly.
- ❖ It indicates that for every additional 1% change in each variable, we can expect GDP to increase by average of 0.1%, 0.04% and 0.35% correspondingly.

### Thoughts & Improvements

- ❖ The impact on GDP growth decreases as we include all three variables in the model.
- ❖ Future Improvement:
  - ❖ Test independence between each variable.
  - ❖ Run F test for additional variable.

# Thank you!
